Machine learning is to design and analyze algorithms that allow computers to "learn" automatically, and allows machines to establish rules from automatically analyzing data and using them to predict unknown data. Traditional machine learning approach is difficult to meet the needs of Internet of Things (IoT) only through its outdated process starting from problem definition, appropriate information collection, and ending with model development and results verification. But however, recent scenario has dramatically changed due to the development of artificial intelligence (AI) and high-speed computing performance. Therefore, deep learning is a good example that breaks the limits of machine learning through feature engineering and gives astonishingly superior performance. It makes a number of extremely complex applications possible.

Machine learning has been applied to solve complex problems in human society for years, and the success of machine learning is because of the support of computing capabilities as well as the sensing technology. An evolution of artificial intelligence and data-driven approaches will soon cause considerable impacts to the field. Search engines, image recognition, biometrics, speech and handwriting recognition, natural language processing, and even medical diagnostics and financial credit ratings are all common examples. It is clear that many challenges will be brought to publics as the artificial intelligence infiltrates into our world, and more specifically, our lives.

Deep learning has been more mature in the field of supervised learning, but other areas of machine learning have just started, especially for the areas of unsupervised learning and reinforcement learning. Deep Learning has very good performance in speech recognition and image recognition. Two common models, Convolutional Neural Network (CNN) and Recurrent Neural Network (RNN), are best instances. However, applying deep learning to solve problems will encounter some challenges. In order to have good performance, deep learning algorithms require a large and diverse range of data, and a large number of parameters need to be tuned. Furthermore, well-trained deep learning model tend to have overfitting problems, and not easily be applied in other areas. In addition, the training process of deep learning is still a black box, and researchers have a hard time understanding how they are learning and how they deduce conclusions.

Therefore, in order to boost performance and transparency of deep learning models and to bring them actually to a level of high practical usage in real-world applications and facilities, this special issue places a special attention for: i.) on the (complexity) reduction of parameters in deep-learning models, ii.) an enhanced interpretation and reasoning methods for explaining hidden components in deep learning models as well as for gaining a better understanding of the outputs of deep learning models (=> increasing acceptability for company experts and users) and iii.) on methods for incrementally self-adapting and evolving deep learning models, where not only weight parameters may be recursively updated, but also internal structures may be evolved and
pruned on the fly based on current changes and drift intensity present in the system. Furthermore, new deep learning methods in combination with renowned, widely-used architectures, but also developed for soft computing and artificial intelligence environments where it has been not considered so far (e.g., deep learning SVMs or deep learning fuzzy systems are hardly existing) are also warmly welcomed. So are new emerging applications and new developments of established applications of deep learning approaches, with specific emphasis in the fields of big data, internet of things, social media data mining, web applications.

Thus, this special issue aims to bring together various research and development achievements in exploring techniques, applications, and challenges that face the evolution of artificial intelligence in the context deep learning. Interested topics include, but not limited to:

**Topics**

- **Methodologies, and Techniques**
  - New methods for Artificial Neural Networks in combination with Deep Learning
  - New learning methods for established deep learning architectures
  - Faster and more robust methods for learning of deep models
  - Methods for non-established deep learning models (deep SVMs, deep fuzzy models, deep clustering techniques, …)
  - Complexity Reduction in and Transformation of Deep Learning Models
  - Interpretability Aspects for a better Understanding of Deep Learning Models
  - Reasoning of Input-Output Behavior of Deep Learning Models (toward Understanding their Predictions)
  - Deep Learning Classifiers combined with Active Learning
  - Evolutionary–based optimization and tuning of deep learning models
  - Hybrid learning schemes (deterministic with heuristics-based, mimetic)
  - Incremental learning methods for self-adaptive deep models
  - Evolving techniques for deep learning systems (expanding and pruning layers, components etc. on the fly)
  - Transfer learning for deep learning systems

- **Applications**
  - Deep learning for sensor informatics and behavioral / activity profiling
  - Deep learning for imaging informatics and large-scale mining / classification
  - Deep learning for translational bioinformatics and drug discovery
  - Deep learning for medical informatics and public health
  - Deep learning for context-awareness and IoT Application
  - Deep learning for smart healthcare, smart living and smart cities

**Important dates**

Submission due: 30 September, 2020
Notification of final acceptance: 31 December, 2020
Final papers: 31 March, 2021
Submission
Submissions to the special issue will be screened by the Special Issue Editors to insure that they conform to the quality standards of *Journal of Medical Imaging and Health Informatics*. Papers that do not pass this initial screening will be immediately returned to the authors. Reviewers will apply those standards in forming recommendations for acceptance, revision, or rejection. A maximum of two revisions will be invited. Papers should be formatted with *Journal of Medical Imaging and Health Informatics* style (http://www.aspbs.com/jmihi/). The submission deadline is **September 30, 2020**. The prospective contributors should submit their papers directly to the online submission system (https://mstracker.com/submit_0.php). In addition, Authors please state the Special Issue (Deep Learning in Biomedical and Healthcare: Emerging Trends, Applications and Research Challenges) & the name of Guest Editor in the on-line submission with cover letter.

Note: The publisher has implemented with immediate effect that all papers submission must provide its respective plagiarism report on the value of similarity index (to be less than 12%): without this, no papers will be processed.

Manuscript-Processing Fees:

All new manuscripts submitted to this journal will be subjected to a Manuscript Processing Fee. Research article publishing is not without occurring costs and the costs have been steadily increasing. To defray part of the publication cost, the journal will charge manuscript-processing fees, to be paid by the authors or their affiliated research institutions. The publication fee will be used to defray part of the occurring expenses associated with manuscript processing, editorial work flow, typesetting, proofreading, printing, online-hosting, and archiving. Authors or their affiliated research institutions are required to pay US$1080 for their articles for a special issue article from all Countries. The authors will receive the PDF version of their research papers in final form. When submitting a manuscript through online, it will be processed with an understanding that the corresponding authors fully agree to pay all manuscript-processing fees upon acceptance. The author who submits the manuscript to the journal is fully responsible for the manuscript-processing fees. Accepted peer reviewed manuscripts will not be processed and forwarded to production until all fees are paid in full to the publisher. The Publisher will issue an invoice of manuscript processing fees after a manuscript has been accepted for publication. The Corresponding author will be asked to submit a signed Copyright Transfer Agreement (CTA) along with manuscript processing fees.
